

- **Tricyclic Medications (Antidepressants)**

Tricyclic antidepressants have the ability to sometimes interact with certain medications that are used during surgery, dental procedures or emergency treatment. These interactions could increase the likelihood of unwanted side effects. It is very important to make sure you tell your surgeon or physician before any surgical or dental procedures that you are being maintained on this class of antidepressants. Tricyclic antidepressants also have the ability of changing the results of certain medical tests.

Life-threatening reactions, such as extremely high blood pressure, may occur when tricyclic antidepressants are taken with other antidepressants called monoamine oxidase (MAO) inhibitors (such as Nardil and Parnate).
